# GET ENERGIZED WITH US

# COMPANY PROFILE

ZEZ SILKO s.r.o. is a reputable manufacturer of power capacitors, capacitors for power electronics, capacitors for induction heating and many other capacitor types. Company ZEZ SILKO s.r.o. provides complete power factor correction service including: power system evaluation including harmonic analysis, technical and commercial quotations, capacitor banks production and commissioning. Components for power factor correction and regulation of electrical energy are also supplied. ZEZ SILKO products are being exported to countries all around the world. They are for use on traction systems (locomotives, trams, trolleybuses), green energy generation (wind and photovoltaic power plants), energy sector (power factor correction) and also induction heating equipment. ZEZ SILKO s.r.o. has always been and will continue to be your reliable business partner.

European manufacturer  
of capacitors

Tradition of capacitor  
production since 1930

Emphasis to quality of  
products

Quality control system (ISO 9001)  
since 1999

IRIS certification since  
2014

Products are exported to countries  
all around the world

# POWER ELECTRONICS

## Applications

### Energy - Production and distribution of electricity

- Wind power plant
- Photovoltaic power plant
- ESS - Energy Storage Systems
- UPS - Uninterruptible Power Supply/Source

### Industry

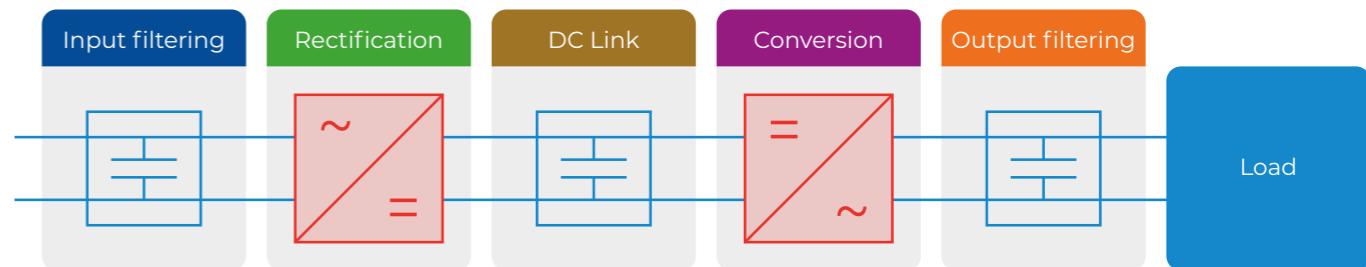

- Machinery - Drives of industrial lines and equipment
- Oil and mining industry

### Transport

- Railway traction vehicles - Electric trains
- Trams, Trolleybuses, Metro
- Electric and hybrid buses

### Others

- Medical equipment, Laboratory, etc.

## DC link capacitors

- › DC filters of power converters

**Voltage:** up to 3 kV DC  
**Capacitance:** up to 4 500 µF  
**Low stray inductance**

## AC filter capacitors

- › Power converters (AC current filtering)

**Voltage:** up to 3,5 kV  
**Capacitance:** up to 600 µF  
**Overpressure disconnector**

## Snubber capacitors

- › Semiconductors protection (IGBT, SCR)

**Voltage:** up to 10 kV DC  
**Capacitance:** up to 60 µF  
**Extremely low stray inductance**

## DC link capacitors

- › DC filters of power converters

**Voltage:** up to 6 kV DC  
**Capacitance:** up to 20 000 µF  
**Low stray inductance**

## Standards

- **IEC 61071** – Capacitors for power electronics
- **IEC 61881** – Railways applications - Capacitors for power electronics
- **EN 61373** – Railways applications - Shock and vibration tests
- **EN 45545** – Railways applications - Fire protection on railway vehicle
- **UL 810** – US standard for capacitors

## Design

MKP capacitors uses polypropylene film as the dielectric, which excels in low dielectric loss. PP film is metalized with a thin layer of zinc-aluminium alloy. Two layers of metalized film are wound into cylindrical windings. Flat sides of windings are contacted with zinc layer ensuring connection to terminals.

Special structure of winding ensures feature called "self-healing". In the event of voltage breakdown, the metal layer is evaporated around the breakdown channel in very short time. Thanks to evaporation, no conductive channel is created between both metal layers and capacitor remains in full functionality.

### Case

Most of our capacitors - cylindrical DC Link capacitors, AC filters, some types of rectangular DC Link or impulse capacitors - are cased in aluminium can. Other bigger rectangular capacitors may be encapsulated in stainless steel can. Plastic housing is mainly used for snubber or impulse capacitors.

### PU resin

Winding elements are very vulnerable to humidity, oxygen and other environmental interferences. Therefore capacitors are filled with PU resin to protect winding elements from entering by air environmental interferences. As a result, is extension of lifetime of capacitor. On top of that resin also keeps winding elements mechanically safe and fixed against any vibrations.

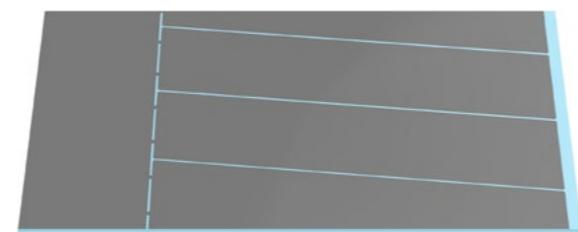

### Dry system

No impregnation is used for metalized polypropylene film.

## Safety System

### Segmented film

Segmented film offers one of the most important internal protective mechanism that ensures safe operation through the lifetime, ageing and during overload of the capacitor. Special segmented metallization feature fuse gates protect capacitor element from internal faults in case of improper self-healing caused by weak spots in PP film. Fuse gates are limiting current flowing into the weak spot and disconnects particular segment. Which protects winding element from destruction. Depending on rated voltage and type of foil, different segments are used. Capacitance decrease takes place when the capacitor is on the edge of its lifetime. Segmented film is used in DC applications.

### Overpressure disconnector

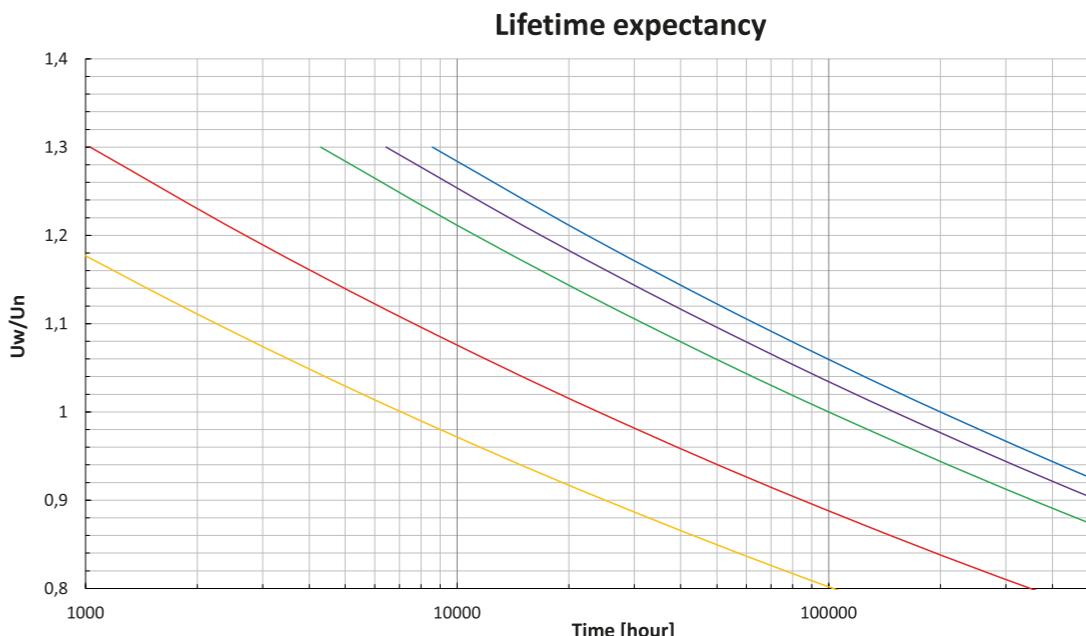

There is an attenuated spot at internal wiring of the capacitor. When pressure starts to increase, case expands. Pressure is forced to push the lid, where terminals are placed. Expansion of the lid cause separation of connecting wires at attenuated spot and capacitor disconnects. Only AC filters capacitors use overpressure disconnector.

### Pressure switch

Pressure switch might be used for capacitors with hermetical housing. When self-healing system fails, surge of temperature and pressure occurs and the capacitor might tear up. Overpressure sensor detects the surge of pressure and provides signal which shall be used for safety circuit and disconnection of capacitor. Sensor contains NC or NO switch. Switch is activated when overpressure reaches 0,3-0,5 bar. Switching voltage and current up to 250 V and 5 A.

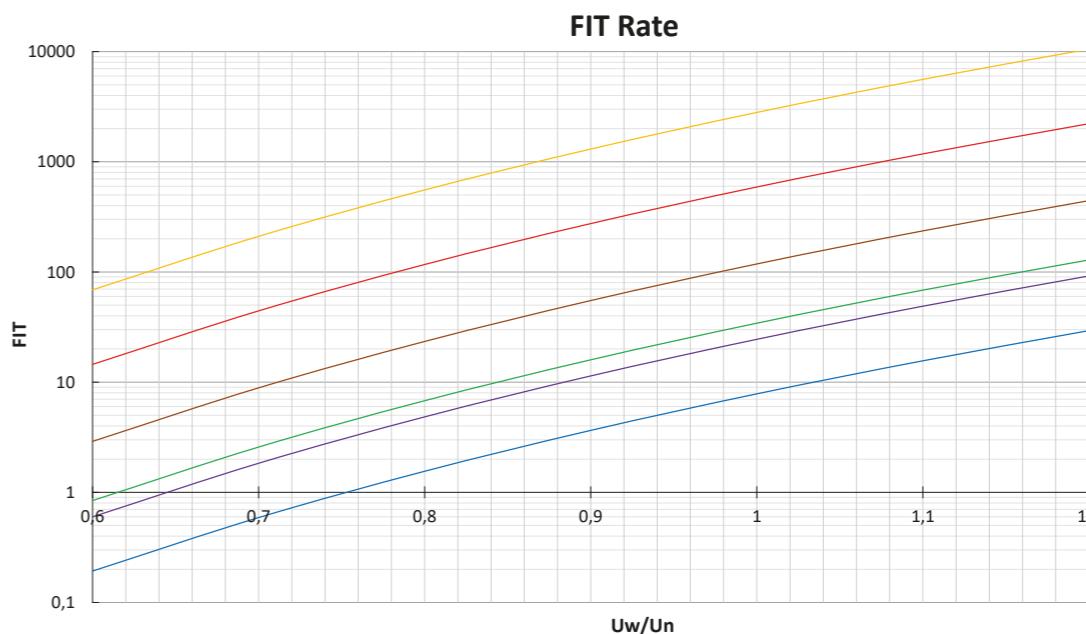

## Lifetime

Capacitor lifetime depends strongly on hotspot temperature and working voltage. The higher the hotspot temperature and the voltage is, the lifetime decreases exponentially. Hotspot temperature is linked with current load of the capacitor. Lifetime expectancy, described in graph below, is calculated according to previous experiments, long-time experiences and theoretical predictions. Graph is theoretical curve and lifetime of different types of capacitors may vary. Standard designed lifetime is 100.000 hours at hot spot temperature 70°C.

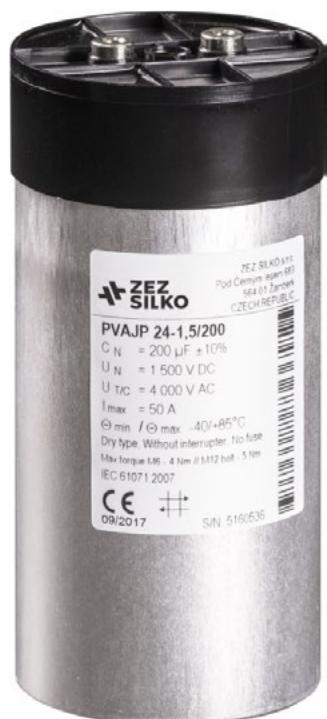

## FIT Rate

FIT (failures in time) represents probability of failure during operating procedure under specific conditions. In the other word, it provides information about what can we expect when capacitor is overloaded. It is statistic value calculated from long-time experiences and theoretical predictions. FIT rate depends mainly on working hot spot temperature and applied working voltage but of course also on capacitor design itself.

# Snubber Capacitors

## General technical parameters

<b>Rated voltage</b>	700 V – 12 000 V DC
<b>Rated capacitance</b>	0,1 µF – 60 µF
<b>Capacitance tolerance</b>	±10 %
<b>Voltage test between terminals</b>	1,5 x U <sub>N</sub> DC/10 s
<b>Mounting position</b>	Any
<b>Case temperature</b>	-40/85 °C
<b>Storage temperature</b>	-40/85 °C
<b>Hot spot</b>	max 85 °C
<b>Lifetime expectancy</b>	100 000 – 150 000 h
<b>FIT</b>	50
<b>Case</b>	Plastic - PA

# Snubber Capacitors

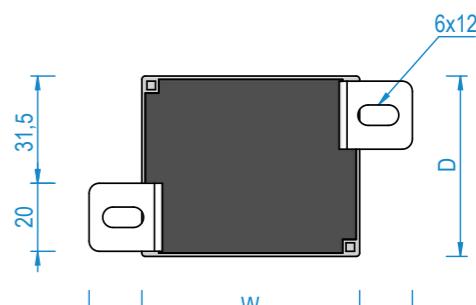

## General technical parameters

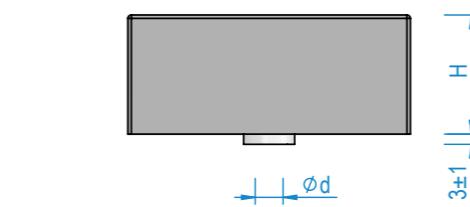

<b>Rated voltage</b>	800 V – 12 000 V DC
<b>Rated capacitance</b>	0,01 µF – 10 µF
<b>Capacitance tolerance</b>	±10 %
<b>Voltage test between terminals</b>	1,5 x U <sub>N</sub> DC/10 s
<b>Mounting position</b>	Any
<b>Case temperature</b>	-40/85 °C
<b>Storage temperature</b>	-40/85 °C
<b>Hot spot</b>	max 85 °C
<b>Lifetime expectancy</b>	100 000 – 150 000 h
<b>FIT</b>	50
<b>Case</b>	Plastic - PA

# CUSTOM SOLUTION FOR POWER ELECTRONICS

## General technical parameters

<b>Rated voltage</b>	500 V – 6 000 V DC
<b>Rated capacitance</b>	25 µF – 24 000 µF
<b>Capacitance tolerance</b>	±10 %, other on request
<b>Voltage test between terminals</b>	1,5 x U <sub>N</sub> DC/10 s
<b>Mounting position</b>	Any
<b>Case temperature</b>	-40/85 °C
<b>Storage temperature</b>	-40/85 °C
<b>Hot spot</b>	max 85 °C
<b>Lifetime expectancy</b>	100 000 - 200 000 h
<b>FIT</b>	50 – 200
<b>Case</b>	Aluminium or stainless steel
<b>Safety device</b>	Optional - segmented film or pressure switch

## DC Link Capacitors

## Design of capacitors

Rectangular capacitors offers wide range of design possibilities to fulfill all customer demands to offer comprehensive solution for the final application. High capacitance, voltage, current rating or extremely low self inductance as well as special terminals and overall dimensions and long lifetime are apparent requirements.

For higher safety of the capacitors in operation there is optional solution to use segmented film or pressure switch. The segmented film can be used in almost all available designs, the pressure switch is only for hermetically sealed containers.

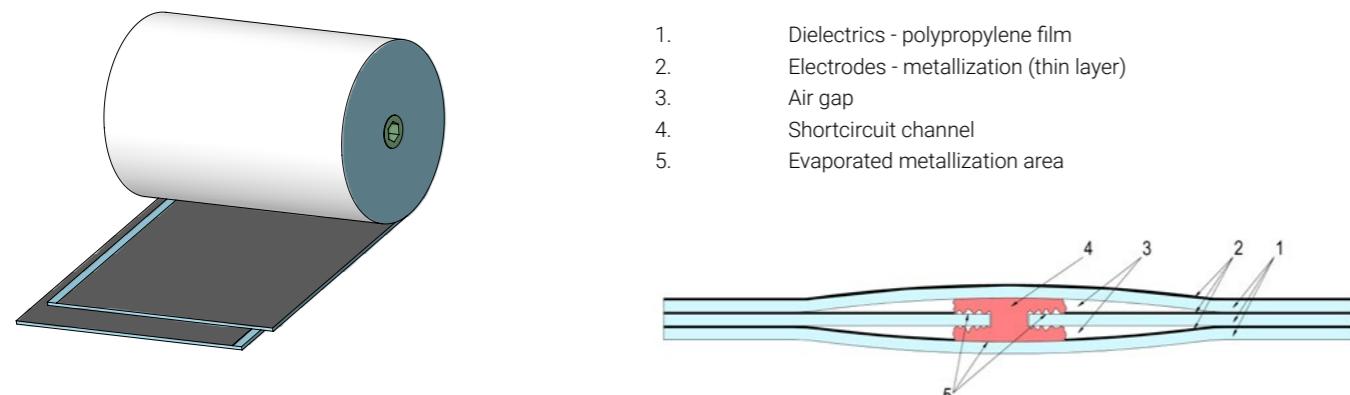

The capacitor housing may be hermetically sealed (customer design No 1) or with PUR layer on terminals side (customer design No 5) or with PUR layer on the bottom (customer design No 2). The material of the container may be stainless steel or aluminium alloy AlMg3. Aluminium containers are without surface treatment, stainless steel containers are painted.

Capacitors are filled with PU resin to protect winding elements from environmental interferences. On top of that resin also keeps winding elements mechanically safe and fixed against any vibrations.

## Protection and Reliability

### Self-healing

Special structure of winding ensures feature called "self-healing". In the event of voltage breakdown, the metal layer is evaporated around the breakdown channel in very short time. Thanks to evaporation, no conductive channel is created between both metal layers and capacitor is not restrained in functionality.

### Pressure switch

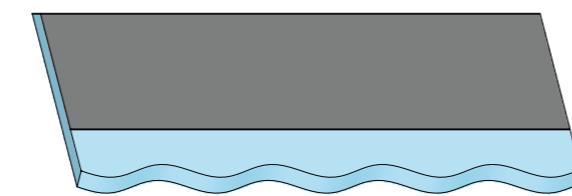

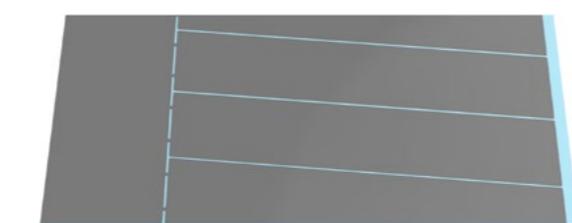

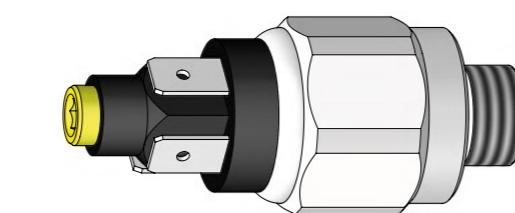

Pressure switch might be used for capacitors with hermetical housing. When self-healing system fails, surge of temperature and pressure occurs and the capacitor might tear up. Overpressure sensor detects the surge of pressure and provides signal which shall be used for safety circuit and disconnection of capacitor. Sensor contains NC or NO switch. Switch is activated when overpressure reaches 0,3-0,5 bar. Switching voltage and current up to 250 V and 5 A.

### Segmented film

Segmented film offers one of the most important internal protective mechanism that ensures safe operation through the lifetime, ageing and during overload of the capacitor. Special segmented metallization feature fuse gates protect capacitor element from internal faults in case of improper self-healing caused by weak spots in PP film. Fuse gates are limiting current flowing into the weak spot and disconnects particular segment. Which protects winding element from destruction. Depending on rated voltage and type of foil, different segments are used. Capacitance decrease takes place when the capacitor is on the edge of its lifetime.

### Wavecut

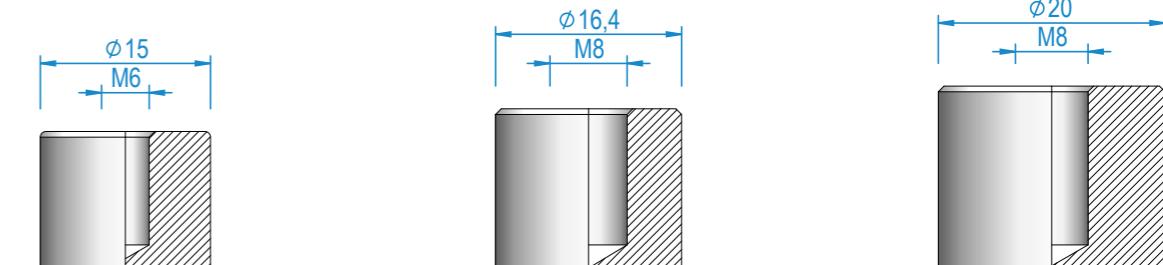

Wavecut is a special wavy edge of PP film, which provides more reliable contact with metallizing zinc layer. Film with wavecut allows higher current load of the winding element.

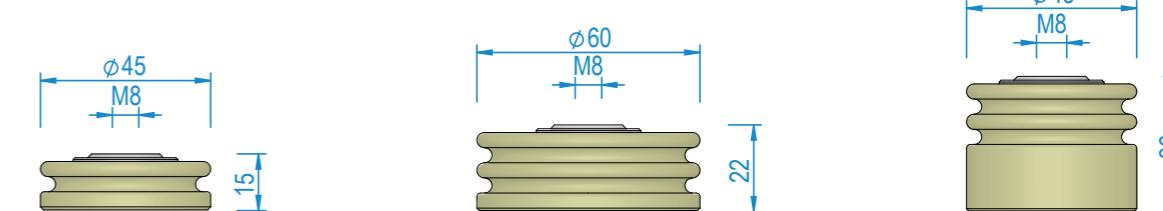

## Terminal Options

Cylindrical or flat terminals are available. First possibility is cylindrical, никелед brass terminal with an inner thread (typically M6-M8). Other possibilities are cylindrical, никелед brass terminal with inner thread and insulator or никелед bolt terminal with insulator. Terminals may vary in number and height according to customer specification. Flat terminals, also called "Capacitors with integrated busbar", are made of никелед copper. Generally, customer specified solution. Commonly used terminals are at pictures below.

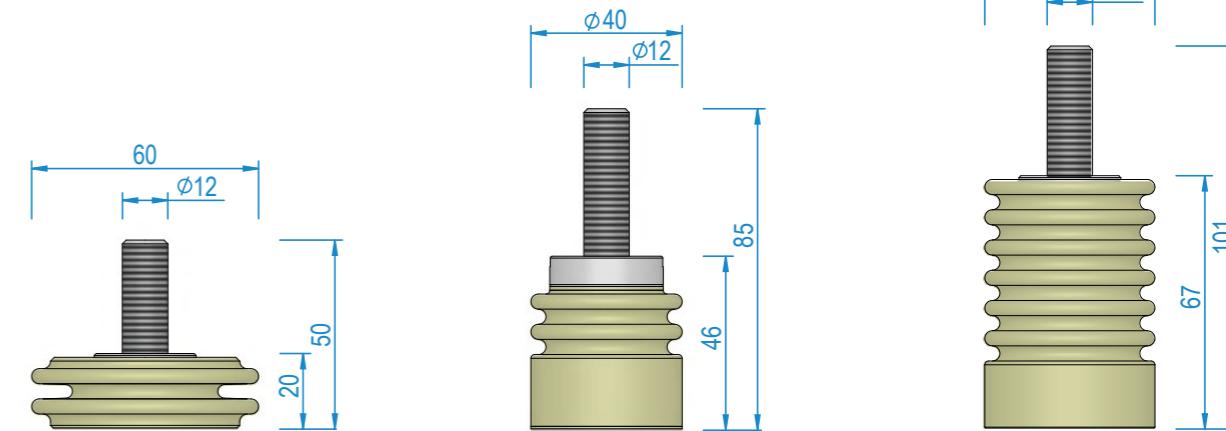

### Inner thread terminal through PU resin

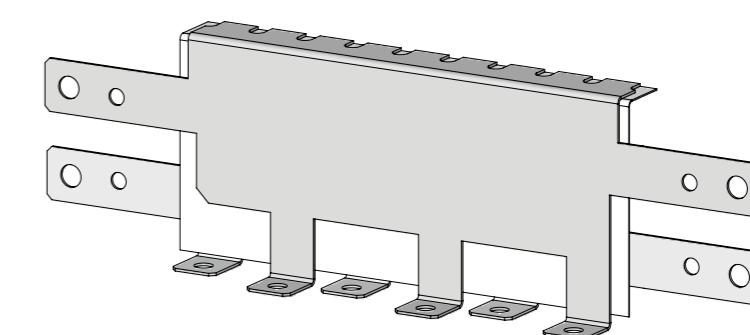

### Inner thread terminal with insulator

### Terminal bolt with insulator

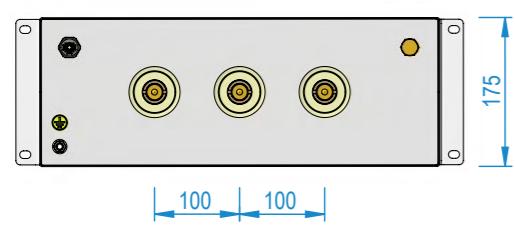

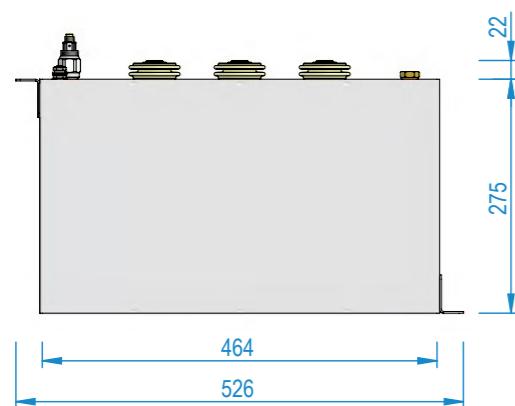

### Busbar terminals
